## Pericentric inversion of chromosome 9

- Described for the first time in 1972 (Wahrman et al, 1972)
- Considered to be a clinically insignificant heterochromatine variant of the human karyotype (ISCN 2009)
- Relative common finding (1-4 \% of general population)
- At least two major cytogenetic variants of the inv(9) exist:
- inv(9)(p12q13)
- inv(9)(p12q21)

- However, on the molecular-cytogenetic level (FISH studies), at least six different variants exist (Starke et al, 2002)
- inv(9) is repeatedly mentioned in association with various clinical diagnoses, especially with reproduction failure

## Questions and hypotheses

- How common is the inv(9) in the Czech Republic?
- Is there any possible association between inv(9) and reproduction failure (or other diagnose)?
- Should the inv(9) carriers be accepted as gamete donors?
- Hypotheses:
- The inv(9) is very common finding in the Czech Republic.
- The inv(9) has no clinical significance and is not associated with any clinical diagnose.
- Proposed type of study:
- Retrospective epidemiological analysis of inv(9) carriers

## Data sources 1

- National Registry of Congenital Anomalies of the CZE:
- Includes all diagnoses from the ICD-10 Q00-Q99 group
- All cases identified up to 15th year of age of affected individual are included
- However...
- There is no specific ICD-10 code for inv(9)
- A lot of inv(9) cases are identified after the 15th year of age
- Many specialists do not consider inv(9) to be harmful so they do not report it at all
- The National Registry couldn't be used this time

## Data sources 2

- Cytogenetic databases and archives in:
- General University Hospital (Prague)
(Antonin Sipek jr., Romana Mihalova, Ales Panzcak)
- Thomayer University Hospital (Prague)
(Antonin Sipek, Vladimir Gregor, Jiri Horacek)
- Pronatal Sanatory (Prague)
(Antonin Sipek, Vladimir Gregor, Petr Lonsky, Vladimir Sobotka)
- Gennet (Prague)

## EGENNET:

(Jiri Horacek, David Stejskal)

## Results 1

## Number of inv(9) cases in different laboratories

| Laboratory | TUH | GUH | Gennet | Pronatal | Total |
| :--- | :---: | :---: | :---: | ---: | ---: |
| Time period | $1980-2010$ | $1986-2010$ | $1996-2010$ | $2002-2008$ |  |
| inv(9) cases | $\mathbf{1 3 3}$ | $\mathbf{1 7 3}$ | $\mathbf{1 6 4}$ | 78 | 548 |
| Total cases | 7884 | 10928 | 15528 | 4447 | $\mathbf{3 8 7 8 7}$ |
| Inv(9) incidence | $\mathbf{1 . 6 8 7 \%}$ | $\mathbf{1 . 5 8 3 \%}$ | $\mathbf{1 . 0 5 6 \%}$ | $\mathbf{1 . 7 5 4 \%}$ | $\mathbf{1 . 4 1 3 \%}$ |
| Males | 67 | 69 | 78 | 32 | $\mathbf{2 4 6}$ |
| Females | 66 | 104 | 86 | 46 | $\mathbf{3 0 2}$ |
| Sex ratio (F/M) | 0.985 | 1.507 | 1.103 | 1.438 | $\mathbf{1 . 2 2 8}$ |

## Results 2

## Indication diagnoses in the whole inv(9) group ( $\mathrm{n}=527$ )

## Results 3

## Comparison of diagnoses in inv(9) and control group

$\operatorname{Inv}(9)$ group ( $\mathrm{n}=163$ ) is composed of $\operatorname{inv}(9)$ cases from General University Hospital

Control group ( $\mathrm{n}=515$ ) is composed of randomly selected (systematic sampling method) patients with absolutely normal karyotype from General University Hospital

Reproduction failure: The difference is statistically significant $p=0.04$, relative risk $=1.35(95 \% \mathrm{CI}=1.03-1.77)$

## Results 3

## Comparison of diagnoses in inv(9) and control group

## Results 4

Comparison of inv(9) incidence in reproduction failure and control group
Reproduction failure group ( $\mathrm{n}=761$ ) is composed of patients ( 93 individuals and 334 couples) karyotyped because of idiopathic sterility between 2007 and 2009 General University Hospital

Control group ( $\mathrm{n}=855$ ) is composed of fetuses karyotyped solely because of the advanced age of their mothers ( 35 years and over) between 2003 and 2009 in General University Hospital
$\operatorname{lnv}(9)$ carriers: The difference is not quite significant $\boldsymbol{p}=\mathbf{0 . 0 8}$, relative risk $=1.42(95 \% \mathrm{Cl}=1.05-1.94)$

## Results 4

Comparison of inv(9) incidence in reproduction failure and control group

|  | Reproduction failure group | Amniocentesis group |
| :--- | ---: | ---: |
| Patients | $\mathbf{7 6 1}$ | $\mathbf{8 5 5}$ |
| Males | 388 | 413 |
| Females | 373 | 442 |
| Sex ratio (F/M) | 0.96 | 1.07 |
| inv(9) carriers | $\mathbf{1 4}$ | $\mathbf{7}$ |
| inv(9) incidence | $\mathbf{1 . 8 4 \%}$ | $\mathbf{0 . 7 9 \%}$ |
| Males | 7 | 3 |
| Females | 7 | 4 |
| Sex ratio (F/M) | 1.00 | 1.33 |

## Results 5

## Estimates of population incidence of inv(9)

|  | All cases | inv(9) cases | Incidence |
| :--- | ---: | ---: | ---: |
| Group | Gamete donors - Pronatal Sanatory |  |  |
| Males | 111 | 1 | $0.90 \%$ |
| Females | 373 | 6 | $1.61 \%$ |
| Total | $\mathbf{4 8 4}$ | $\mathbf{7}$ | $\mathbf{1 . 4 5 \%}$ |
| Group | $\underline{\text { Children awaiting adoption -TUH }}$ |  |  |
| Males | 235 | 5 | $2.13 \%$ |
| Females | 176 | 5 | $2.84 \%$ |
| Total | $\mathbf{4 1 1}$ | $\mathbf{1 0}$ | $\mathbf{2 . 4 3 \%}$ |
| Group | Amniocentesis group - GUH |  |  |
| Males | 413 | 3 | $0.73 \%$ |
| Females | 442 | 4 | $0.90 \%$ |
| Total | $\mathbf{8 5 5}$ | $\mathbf{7}$ | $\mathbf{0 . 8 2 \%}$ |

## Conclusion

- The inv(9) is relatively common finding in CZE:
- The laboratory incidence: $1.06 \%-1.75 \%$
- Estimated population incidence: 0.82\%-2.43\%
- The inv(9) is an insignificant variant:
- We are still uncertain. It is clear, that the majority of inv(9) carriers has no trouble at all. However, the possible association of $\operatorname{inv}(9)$ and reproduction failure wasn't excluded (nor confirmed) right now.
- More specific analyses are needed:
- Molecular cytogenetic methods are needed for further examination of each single case of inv(9)
- We will try to find specific associations for specific (sub)variants of chromosome 9 heterochromatine area
